

Title of Metamaterials European School, September 1-2, 2017
Modelling of metamaterials:
numerical methods and homogenization techniques

Lecturers (by alphabetical order): Anne-Sophie Bonnet Bendhia (Paris, France), Elena Cherkav (Salt-Lake City, USA), Richard Craster (London, UK), Agnes Maurel (Paris, France), Ross McPhedran (Sydney, Australia), Sasha Movchan (Liverpool, UK), Alejandro Rodriguez (Princeton, USA), Igor Tsukerman (Akron, USA) and Martin Wegener (Karlsruhe, Germany),

Preliminary Program- Day 1 (Friday September 1st)

8:00-8:50 Registration

8:50-9:00 Opening Ceremony

9:00-10:20: Anne-Sophie Bonnet Bendhia (ENSTA Paris & CNRS, France): Numerical models of sign-shifting refraction index media

The abstract: TBA

10:20-10:40 Coffee Break

10:40-12:00: Agnes Maurel (ESPCI Paris & CNRS, France): Homogenization of thin interfaces

The abstract:

A homogenization approach will be presented to derive effective jump conditions applying across a microstructured interface. The homogenization is based on two scale expansions of the field in the near and far fields and on the asymptotic matching of the near and far fields. This allows to build an equivalent problem where the effect of the evanescent field is encapsulated in effective parameters entering in jump conditions. The validity of the equivalent problem will be inspected in several scattering problems.

This lecture is based on the joint work with J.-J. Marigo.

12:00-13:20 Lunch

13:20-14:40: Ross McPhedran (Sydney, Australia): Multipole methods in photonics and phononics

The abstract: TBA

14:40-15:00 Coffee Break

15:00-16:20: Alexander Movchan (University of Liverpool): Chiral elastic metamaterials and directional localisation

The abstract:

Geometrically chiral periodic media are straightforward to design and construct. However, these are very different from true chiral periodic systems which support directional preference in propagation of elastic waves. The lecture is based on several recent publications addressing the properties of elastic Floquet-Bloch waves in lattices with built-in gyroscopes. These create efficient filters and polarisers of elastic waves. In particular, one can design a multi-scale chiral elastic medium, which supports only shear waves. Dispersion properties of Floquet-Bloch waves are accompanied by the analysis of defect modes as well as spatial localisation. One of counter-intuitive and striking illustrations includes a

system of gyros embedded into an elastic periodic lattice in such a way that it supports a localised waveform along a rhombus.

This lecture is based on the joint work with I.S. Jones, M. Brun, G. Carta, N. Movchan and M. Nieves.

16:20 – 17:00: Q&A Panel Session

18:00-21:00: Social event: Dinner party on boat

Preliminary Program- Day 2 (Saturday September 2nd)

9:00-10:20: Elena Cherkaev (University of Utah, Salt-Lake City, USA): Inverse problems and homogenization

The abstract: TBA

10:20-10:40: Coffee Break

10:40-12:00: Martin Wegener (Karlsruhe Institute for Technology): 3D metamaterials: It all starts with the design

The abstract:

Designing metamaterials is a bit like arts. You have to be creative. Come up with new ideas for unusual effective material behavior that possibly nobody has ever seen before. Then comes the sweat. To test the idea under realistic assumptions, numerical calculations are quite often a must. Structures need to be optimized iteratively given certain constraints. Gaining an intuition is crucial. On the basis of the gained blueprints, we then fabricate 3D metamaterials by 3D laser nanoprinting. Finally, measurements on these samples are compared with numerical results to assess the quality of the achieved.

In this lecture, I will discuss selected recent examples for the above process. This includes mechanical metamaterials (pentamode, buckling, negative thermal expansion, negative static compressibility, micropolar, micromorphic) and semiconductor metamaterials (sign-reversed Hall-coefficient, parallel Hall effect).

12:00-13:20 Lunch

13:20-14:40: Richard Craster (Imperial College London, UK): High-frequency homogenization of acoustic and electromagnetic metamaterials

The abstract: TBA

14:40-15:00 Coffee Break

15:00-16:20: Alejandro Rodriguez (University of Princeton): Computational methods and large-scale inverse design in nanophotonics: from nonlinear optics to thermal radiation

The abstract:

As the power requirements of devices continues to scale down, nonlinear optical interactions and even tiny effects due to thermal and quantum fluctuations of matter can have a profound impact on their functionalities. We survey recent computational methods and large-scale inverse-design techniques which have begun to shed light on decades-old as well as emerging problems in nanophotonics. From nonlinear frequency conversion and single-photon emission to emerging problems in the areas of thermal radiation and radiative heat transport, a commonality among these is the need to confine and

tailor light over broad bandwidths and small volumes (with applications to thermal photovoltaics and single-photon sources), creating challenges for traditional photonic design methodologies based on index guiding or band-gap engineering.

16:20-17:40: Igor Tsukerman (University of Akron): Effective medium theories backward in time: From the 21st to the 19th century (Non-Asymptotic and Nonlocal Approximations, Finite Samples, Interface Boundaries)

The abstract:

Research in electromagnetic metamaterials started three decades ago, if not earlier, and exploded in the 2000s as a quest for “perfect lenses,” “perfect absorbers,” etc. But, as the field of metamaterials matured, it became clear that ideal devices were not realizable because of losses, finite lattice cell sizes, and other factors. Undoubtedly, however, “imperfect” materials and devices will continue to be developed, and we can therefore expect a growing need for more sophisticated methods of their analysis and, more specifically, for accurate homogenization theories valid for any composition and size of the lattice cell.

The objective of homogenization (effective medium theory) is to describe a composite structure in terms of effective parameters accurately representing reflection, transmission and propagation of waves on the scale coarser than the lattice cell size.

The lecture introduces a homogenization methodology valid in both electrostatics and electrodynamics and applicable to an arbitrary size and composition of the lattice cell. Nonlocal effects can be included in the model, making order-of-magnitude accuracy improvements possible.

We then travel backward in time and explore the connection between the new framework and the classical 19th – early 20th century theories of Clausius-Mossotti, Lorenz-Lorentz, Maxwell Garnett.

This lecture is based on the joint work with V. Markel.

17:40 – 18:00: Closing remarks and farewell
